

SIT 351: DATABASE IMPLEMENTATION

Assignment

Question 1

- i. Identify a real-life entity about which data can be stored
- ii. Perform data modeling on the entity identified
- iii. Normalize your data to 3NF
- iv. Represent your data in an ERD
- v. Map your entities, attributes, and relationships appropriately

Question 2

A large hospital with multiple branches wants to implement a database system to manage patient records, doctor schedules, medical inventory, and billing. The database must ensure fast retrieval, security, and data integrity.

- i. What type of database would you recommend for this hospital and why?
- ii. How would you handle concurrent transactions to avoid deadlocks and ensure consistency?
- iii. What measures should be taken to prevent data breaches and unauthorized access?
- iv. How can database backup and replication improve the performance of this system?
